

# Flex IT Email Filtering

Ensuring effective business cybersecurity is challenging for all businesses. Attacks come in many forms, and to defend against all of them needs a multi-layered approach to security.

Phishing is the most prevalent attack method in the modern workplace. Emails, designed to look authentic, are sent by fraudsters with the intent to deceive. Such emails can use various different ways to make themselves look authentic, and generally contain a call to action that, when followed, starts to lead the target along the path to becoming another attack victim.

## Flex IT Email Filtering - powered by Proofpoint

Flex IT Email Filtering is a monitored service based around Proofpoint's award-winning email protection platform. The Proofpoint service 'wraps around' the core email platform - either cloud- or server-based - and monitors all email traffic in and out. The service traps suspicious emails, notifies the individual, and reports into a central console.

Flex Email Filtering Professional includes the Email Archiving service, providing a legally valid record of all email traffic for any Microsoft Exchange-based service (including M365). While new data can always be added, data cannot be removed from the archive. Archived emails are held for 10 years.

### Features:

- Spam, virus, and zero-hour threat protection
- Outbound filtering, email encryption and data loss protection (DLP)
- Advanced reporting
- Disaster recovery with email continuity and archiving

### Benefits

- Advanced reporting
- Protects users and the business network from email-borne threats
- Cloud-based service requires no hardware or software to deploy
- Ensures business communications keep running during outages
- Promotes compliance efforts
- Service is updated automatically

## Protect your email

Proofpoint Email Protection is the industry-leading email gateway. It catches both known and unknown threats that others miss. Powered by advanced machine learning technology, Email Protection accurately classifies various types of email. And it detects and blocks threats that don't involve malicious payload, such as Business Email Compromise(BEC), using our Advanced BEC Defence.
